7. Characteristics

7.1 Standard charge
This "Standard charge" means charging the cell with charge current 1440mA and constant voltage 4.2V at 23°C, 96mA cutoff.

7.2 Standard discharge capacity
The standard discharge capacity is the initial discharge capacity of the cell, which is measured with discharge current of 960mA with 2.5V cut-off at 23°C within 1 hour after the "Standard charge". In this case the minimum capacity of the standard discharge capacity is 4,700mAh in warranty.

\[ \text{Standard discharge capacity} \geq 4,700 \text{mAh} \]

7.3 Standard discharge energy
The standard energy is the initial discharge energy of the cell, which is measured with discharge current of 960mA with 2.5V cut-off at 23°C within 1 hour after the "Standard charge". In this case the minimum capacity of the standard discharge capacity is 17.04Wh in warranty.

\[ \text{Standard discharge energy} \geq 17.04 \text{Wh} \]

7.4.1 Initial internal impedance (AC resistance)
Initial internal impedance measured at AC 1kHz after Standard charge.

\[ \text{Initial internal impedance} \leq 35 \text{m} \Omega \]

7.4.2 DC impedance
DC impedance is measured at 50% SOC(state of charge) state.
After Standard charge, discharge with constant current of 2,400mA for 1hr followed by 30min rest time (Check voltage at this time – V1). Discharge with constant current of 2,400mA for 30sec (and check voltage at 10sec – V2)

\[ \text{Initial DC impedance} = (V1-V2)[mV] / 2400[mA] \leq 50 \text{m} \Omega \]

7.4.3 DC impedance growth (DCR (%) increase)
DC impedance growth means % increased DC impedance after cycle or storage test compared with initial DC impedance

\[ \text{DCR} (\%) \text{ increase} = [ (\text{**DCR}(f) / \text{*DCR}(i)) - 1 ] \times 100 \]

* \text{DCR}(i) : initial DC impedance,
**\text{DCR}(f) : DC impedance after cycle or storage test
